**MEN AT WORK ON
Lighter, Smaller
Packages of Power!**

**?
FOR
YOU**

How our people work out new ideas that make airplane accessories smaller and lighter isn't in this photograph.

You don't see, for instance, the plans later come going into these designs, and the secret crew that don't. You don't see the men hours of development and testing it takes to give you exactly what you want.

Experience and a pioneering-minded attitude just can't be photographed. But they are the real reasons why you can depend on Jack & Heintz to develop . . . give . . . and deliver lighter, smaller packages of power!

Airline tells why it switched to B. F. Goodrich brakes

WEST COAST AIRLINES switched to B. F. Goodrich brakes in December, 1948. Months later, an eastern airline added West Coast here it liked them. Here's the reply:

"We operated two years with another type of brake. The maintenance was extremely high on them. . . If we had 100 hours of service out of a brake drum, we were fortunate. Linings would last approximately 400 hours, spindles or brake cylinders 600 to 1000 hours with two-hour jobs in between."

"We installed B. F. Goodrich brakes. . . Since we have been using

these brakes, we have a total of 300 hours service per plane and have only removed one brake assembly. This assembly was removed because of a broken shock spring."

"While replacing this spring, we measured the brake to see how much wear we were getting. We found that they had only worn .002 in a total size of 3.64 inches."

"We have smoother operation, lower maintenance cost and more reliable brakes. . ."

APPROVED FOR SUPER DOLBY

About 1/3 of all DC-3s in U. S. airline operation are now equipped

with B. F. Goodrich Expander Tube brakes. These planes are committed to use BFO brakes with CAA approval, when converted to Super DC-3s. B. F. Goodrich wheels and brakes are also available on request as original equipment on the new Douglas Super DC-3. The B. F. Goodrich Company, Akron, Ohio.

B.F. Goodrich
FIRST IN RUBBER

Clipper Seals are part of one of the most critical mechanical items of the F4U Model 102F-1 Mustang jet fighter. These flexible, yet resilient J.M. seal with unique shock and resistance to wear mechanisms make the difference between maintenance.

"Flying BANANA" hops and skips... with Clipper Seals

Like Pavecks, you'll find that Clipper Seals have many attributes that make them well suited to critical oil sealing jobs in aviation.

For example, Clipper Seals are flexible... which assumes plenty of give and takes for maintaining a tight seal under the most severe operating conditions.

They are also corrosion resistant. Clipper Seal's molded body is entirely non-metallic, and is therefore unaffected by dielectric and most forms of corrosion. To meet unusual conditions, the garter spring which holds the lip to contact with the seal is available in various corrosion-resis-

tant metals... or Clipper Seals of special design that do not require spring coils can be furnished.

These unique and useful oil seal design possibilities, too. They can be furnished in large sections of varying widths to fit practically any cavity. Furthermore, the Clipper Seal has no metal core and is of flexible molded construction. This permits liberal machining tolerances in the design of the cavity.

To find out more about Clipper Seals and their application to your sealing problems, write: Johns-Manville, Box 256, New York 16, N. Y. Ask for folder JK-51A.

Furnished as a split seal, too

For applications on inconvertible seals such as the one shown above on an aircraft reciprocating engine, the split-type Clipper Seal simplifies installation, saves costly down time. It can usually be installed in a matter of seconds. And removed just as quickly and easily—and without damage!

WHO'S WHERE

Changes

► **New Appointments.**—Chas. E. Kline has been named assistant chief to Gerald A. Lian, President W. A. Pittman, and will act as liaison between the president's office and all departments of the company. . . . **Ken Willett** is public information officer for A. V. Roe Canada Ltd., at Montreal, Quebec. He will handle public relations on Avro's air developments. . . . **Paul Gerts** has joined DeSoto Aircraft Service, Inc. as technical adviser to the sales staff.

► **Albion Automotive Corp.** appointed **William E. Hopkins** director of engineering at its Illinois, N. I. plant. . . . **Kenneth H. Jersky** has been appointed supervisor of the capital equipment dept.'s production section at the American Research Foundation of Illinois Institute of Technology.

► **Edward V. Triquet** has been named. Gasification project engineer at Lockheed Aircraft Corp. He had been staff project engineer on the Constellation since 1948.

► **Anthony—Dr. Ray Johnson**, vice president of the General Electric Co. in charge of the chemical department, will retire Dec. 31.

► **Sales Staff.**—Thomas World Afloat has named **J. N. Martin** general sales manager for the Atlantic region, succeeding **W. F. McGuirk**, now assistant vice president of the American Society of Travel Agents. TWA also named **J. H. Higgins** as Chicago district sales manager. He was formerly passenger sales manager for the New York District.

► **American Air Export and Import Co.**, Miami Springs, Fla., named **James Keith** as sales manager. . . . **Raymond S. Colley** is now sales manager at **Boeing and Boeing Tool** at E. F. Goodrich Co. . . . **Robert Schmitt** is now branch manager at **Aurizon** Operations, replacing **Joseph Maki**, resigned, who will continue with the company as a consultant.

► **New Post.**—A. V. Roe Canada Ltd. has appointed **J. H. Berry** to the corporate post of director of manufacturing. He will be responsible for coordination and direction of gas turbine and aircraft manufacturing activities.

► **Raymond—William A. Van Dusen** has been appointed assistant to **Charles Wright Corp.** and has moved his office, which was in the C-W headquarters in New York City. Van Dusen had been acting for the latter area against at C-W and remains available for consultation by the new management.

► **Douglas Expansion.**—Increased sales and aircraft activity in Brazil and Central America by Douglas Aircraft Co. has sent two service vans on field trips. C. B. Galt is touring through Brazil, Argentina, Uruguay and Chile. C. L. Bonham is touring Venezuela, Colombia, Ecuador, Peru, Bolivia, Panama, Costa Rica, Honduras and Guatemala. Both will visit operators of Douglas aircraft.

INDUSTRY OBSERVER

► **BGA** has approved a French government proposal to buy approximately 50 Pratt & Whitney R-2800 engines from the Glenn L. Martin Co. for \$27 million. The engines have been in the Martin inventory in stock, and were originally ordered for Martin 24-2 defense orders which did not get. The French bargains deal has been pending for sometime, and has little relation to Martin's other sales campaign to sell 30 revised models 24-3 to Entente Aéroline. Revised specifications for Entente call for another and slightly more powerful model of the R-2800 to be installed in the revised 24-3.

► **Pratt & Whitney Co.** Intermex plant at Torrance, Calif., is expected to be retooled as a combustion research center. Huge open-roof hangars may be converted into experimental chambers for airflow in drag studies.

► **Allison division of General Motors Corp.** has the production contract to supply turbojets for the Northrop-Saunders E-6A twin-jet night fighters. The deal for the Allison J35-21 used at over 5000 lbs. thrust, USAF had commercialized the General Electric J-47 adopted as the production powerplant for the F-99A, instead of the Allison powerplant.

► **General Aircraft Corp.** is flight testing a new prototype to be entered in Air Force interim competition. Phase is a single-engine high-wing ultrabroad-winged craft which Wichita observes say has excellent lift and climb performance. Phase appears to have been developed from the Cessna 170 low-pitch, except that the fuselage is shorter and belly larger.

► **Douglas** indicated by the Air Force and Naval Aviation in the conversion phase, will extend project new under way is a private version of M. A. Goerrin, New Castle, Del. General has located Transcontinental Aircraft Co., consisting of himself and two mechanics, and is building a conversion plane in a hangar opposite Bellanca Aircraft Corp. The design features two seats, mounted laterally, which using forward in flight is become propellers. He has no customers, either military or civilian, but is going ahead with construction purely as a hobby.

► **U.S. Bureau of Standards** in 1971 will build a radio propagation research laboratory on a 210-acre site at Boulder, Colo., with laboratory facilities covering about 545 acres and staffed by 200-300 scientists. Major research program of the laboratory will be a study of the atmosphere and properties of aircraft navigation and communication frequencies between 30 and 50,000 megacycles.

► **Navy** has tested its new target glider at an altitude of more than 35,000 ft. and at speeds in excess of 440 mph. It was developed by Chance Vought division, United Aircraft Corp., which has produced a similar test group of 45 for flight test and evaluation. The 35th year is in effort to add radar reflection. A drag parachute to prevent coming within 200 ft. in landing is topped automatically upon contact with the runway.

► **A Swiss industrial powerplant firm, Brown, Boveri & Co., Baden, Switzerland** is seeking to install "package" wind tunnels in U.S. research facilities. Companies where installed would provide complete wind tunnel test facilities, allowing speeds of Mach 2.6 and Mach 9. The installation price is \$100,000.

► **Philips** Air Force has ordered one 145 hp. TIMCO T-35 Huskisson military type trainer for evaluation purposes, and the manufacturer is optimistic that the tests will be followed by a quantity production order. Production T-35 version has numerous changes from the prototype development of the commercial Huskisson 350, including fuselage contour changes, three-point retractable seats, new controllable auxiliary-swing engine nacelle, propeller, new design wing, and instrumentations, lighting and equipment arranged to meet USAF training requirements. First production version is scheduled for completion early in January.

► **Sale of the Haviland Vampires** jet fighters in Venezuela. Air Force makes the 11th country to purchase the British jet fighter. Vampires is powered by the Cobalt jet engine which is rated at 1500 lb. thrust, and approved by British 10,600 lb. equivalent between aircraft.

AVIATION WEEK

Dec. 26, 1949

COLLINS: How to sell what CAA wants?

BEALE: By making it a partner in the deal

WRIGHT: So engineering is almost problem.

Boeing Wants CAA to Lead Jet Program

But agency head prefers partnership with military rather than sole responsibility.

(This is the first of a series of articles on U. S. jet transport development problems. These articles were prepared by AVIATION WEEK Editor Robert H. Wood and News Editor Robert Hoots after interviewing key executives and engineers of the leading Pacific Coast transport manufacturers.)

SEATTLE—Boeing Airplane Co. believes a simple solution to jet transport development problems lies in making the Civil Aeronautics Administration responsible for technical and financial administration of a jet transport prototype program.

Boeing spokesman Willard Beall, vice president for sales and engineering, told AVIATION WEEK that the Boeing plan included the following steps:

- Industry and governmental approval for CAA to manage technical and financial responsibility for the jet prototype program
- A special appropriation for the prototype program added to the CAA's fiscal 1951 budget
- A CAA-appointed competition for jet transport designs, in the various categories suggested by the industry as offering the best commercial operational possibilities
- CAA to award contracts to the two top designs in each category for the

building of two prototypes by each winning manufacturer

• Airlines or other operators could obtain the desired quantity of jet transport types of their choice either by buying directly from the manufacturers or by leasing from the CAA, which would also have authority to award production contracts to manufacturers. Airlines would pay CAA for their leases on the basis of the revenue the airlines actually flow by the lease.

Beall pointed out that Aeronautics Admin. has already advocated one of an existing federal agency to coordinate jet prototype development rather than adding to the federal bureaucracy by creating a new agency. The Johnson-Kennedy bill introduced during the 51st Congress proposed to make a federal air corps development corporation with a working capital of \$250 million in federal funds, employing a permanent staff of at least 500,000 or more, politically-appointed directors.

• Civilian Preferred—Use of a civilian agency rather than the military system is more likely, according to Beall, because primary users of jet transports will be the commercial airlines. Transports built for commercial airline operations are always in need for military purposes, but transports built for military requirements cannot be operated

ATA Stand

The nationalized airlines have received the Aeronautics Admin's request for government aid in developing new transport aircraft.

At its annual meeting this month, the Air Transport Ass'n's board of directors adopted a resolution urging for federal participation in providing:

- Jet-powered transports, either of the turbo-prop or pure jet type, or both.
 - A high-efficiency cargo plane.
 - A small transport especially designed for feeder routes.
- ATA recommended that responsibility for the government's interest in the prototype program be assigned primarily to the Air Force and the scheduled airlines represent the civilian interest.

As a further step, ATA urged that the regular air carriers participate with the USAF in a program providing experience in scheduled operation of jet aircraft. ATA said cooperation between the airlines and USAF in producing and operating jet transports is actual because they compose the team which provides air transportation in wartime.

Forum Question: To Be or Not to Be?

Spoke attendance at National Aviation Forum in Washington last week, the latest National Aeronautics Act, sponsor of the forum and of the press on national aviation issues, to be relevant in place.

A committee headed by Frederick C. Crawford, president of Thompson Products, and vice president of NAA, has been asked to study the future of NAA and recommend whether it should exist as a company or division.

R. M. Philip, NAA executive vice-president, will continue to work, and in preparing a report for executive review, following a meeting in February. Other committee members are Richard E. Wilson, NAA chairman of the board, William Anderson, Thompson's accounting director, Robert Rumpel, Air Transport Act committee vice-president, Paul Vance, St. Louis, and Roger White, Kees, NAA's chief financial officer. Louis Lavigne, NAA president, and William Foster, Thompson's accounting director, are also members.

Albuquerque, N.M.—Commercial aviation of the decade and their 1949 increase, the future, appeared the more of dramatic attention from year to year, since the third group which reached a high point of 1300 airplanes at Oklahoma City in 1945, including 765 out of ten years.

This year's financial regulations included only 104 percent. Analysis of the declining support of the annual "how fast" income indicates a growing inefficiency on the part of the larger manufacturers and exhibitors of aircraft to the extent of small operators and other segments of industry who are fighting for survival with no holds barred.

Puerto Rico—High point of the 1949 boom was a point of departure, which the question of government subsidy of commercial aircraft and of an air line question was viewed from various angles.

Sample viewpoints:
By Gerald Wagon Airways: The government should do one of two things: Get out of air business, or help to get out of the air we're in. The New England airport credited the federal government's own financial situation, was surplus surplus and a certain flight training as major contributions to the downfall of small aviation business, and downward, without possible compensation. The NAA's recommendation for a national aviation council to handle research and development for light planes.

Ernest E. Wilson, former United Aircraft president: Called for a decrease

ation of what is already and what is not. Wilson called for the nationalized segment of the airlines to be declared independent and then work to free themselves from federal restrictions growing out of regulation of the industry problem.

J. Carroll Cook, Pan American Airways vice president: Said that despite an crash possibilities in international travel, which had increased for Pan Am 400 percent since inauguration in Sept. 1945, he did not expect it to exit into the de laus air travel market.

Joseph J. O'Connell, Jr., CAA chairman: Called for agencies of real pay from industry, to give airline management "adequate" incentive to act as businessmen and to create a more efficient air transport system.

James W. Austin, Capitol Airlines' vice president: Informed that the 14 million dollar industry and then very large by from 1.7 to 5 million dollar and called for additional efforts in safety and airline ticket pricing to win additional public acceptance for air transportation.

DASSAULT MD-60 fighter will exceed Vought, in production will be passed with...

MD-603, body choice at all weather fighter, is inherent of France's intercept form.

How Long Could France Fight?

A new plan would reorganize its aircraft industry to provide an air defense of two weeks—after five years.

By Boyd France
(McGraw-Hill World News)

PARIS—France is getting set to build a fighter force within the framework of the Atlantic Pact capable of deterring Soviet also for at least two weeks. It will be a short-term force, but it still will take her seven years to get it ready and to do this, the entire French aircraft industry will have to be reorganized. The Minister of National Defense has drafted a five-year plan also to be submitted to the National Assembly. The plan will:

- Define the use and kind of air force France can afford.
- Outline the characteristics of an system industry needed to build and maintain that air force.
- Make possible a long-term flow of production and research effort, instead of the spasmodic, piecemeal work currently being accomplished.
- Determine if there are more than 1000 line and fighter fighters. Relatively small numbers of transport, trainers, and special-purpose planes will make up the rest. Most of the models will be collected from the postwar surplus of

prototypes, but a few will be built from the drawing board up.

All this, if it is to be accomplished within the next seven months, will mean that France's aircraft industry will be radically reorganized. New plants will be closed or converted to other types of production. What remains will be concentrated and reorganized.

Basic Types Planned: The reorganization is keyed to the size and kind of air force France proposes to build. On the production blueprint, the air force would be composed of 12 basic types of aircraft:

- **Interceptor fighter—**Current choice is Dassault MD-121, although the French are considering manufacture of some as previously for the Vought in Vietnam as a stopgap measure until the 41st start making air assembly lines. At full strength, the air force will have roughly 1000 Dassaults as active duty.
- **All-weather fighter—**Only a few has been built, and odds are that will be 500 6003.
- **Medium transport—**Almost entirely, this will be the Nord 2020, but that flown successfully in September-October 200 will be ordered.
- **Light transport—**Air force has already ordered 200 Dassault MD 515, but may buy some 80 915 until the 11th get into production.
- **Trainer and liaison plane—**The two-place Nord 1221 is slated for this job.
- **Intermediate trainer—**This, probably will be the low-wing all-weather Messier 472.
- **Artillery observation plane—**The Messier 500 is the selection.
- **Long distance amphibious—**No prototype yet. Few production craft will be ordered.
- **Carrier-based amphibious—**No prototype designed yet.
- **Amphibious sea rescue plane—**This will be the Nord 1405, two prototypes already have been built.
- **Light amphibious—**Only SCAN 10 have been ordered. This is the Granma Widgum, built under license provided by the Nord 8 G 30 engine developed, 194 by at least 100.
- **Fast liaison plane—**The Nord 1100 has been chosen.

To power these planes, France has the Atom 1011 transport set in the last stage, and the SPENCER 14 14 piston engine. But France will continue to get Nord and other planes in its plan until the Atom is on the available line. And although production will continue on the SPENCER, the French are already engaged to adapt its principal engine Turb 4 Whitties or Buzell such as the Nord.

Production Continued: All three modern decisions will have strong effects on warlike France. Already, the

four automated aircraft companies—S.N. Nord, S.N. Gove, S.N. Sud-Quercy and S.N. Sud-Est—have been cut to three by liquidation of S.N. Gove. And facilities and personnel for maintenance production, as well as inefficient, are to be shifted out of the other three companies.

Agreements:—The reorganization plan, currently based on the somewhat optimistic assumption that the air force and navy will have about \$46 million a year to spend on aircraft. It would mean the combined air force would be active a total appropriation of about \$775 million, as against last year's \$230 million.

France's economy minister, Minister of Finance Maurice Petrot, has made no provision for the reorganization spending in his proposed 1950 budget, but the south Atlantic battle has yet to be fought. If the extra funds can't be spent on the air force, the navy will have to be cut back even further than now planned. Some estimate a 30 percent reduction in the total air force appropriations would result in about a 50 percent reduction in the activity of the automated aircraft industry.

1950 Preview: More Weight, Less Planes

U S aircraft production is heavy of surface weight will be increased during 1950, with the increase expected to amount to approximately 2 million pounds overall. Aircraft deliveries are predicted in a record quantity and new year forecast last week. This will include an expected 5 million pounds of military aircraft, even more than the 4 million pounds in civil aircraft deliveries.

The increase was based on full utilization of plans approved by the Budget Bureau for fiscal 1950 USAF budget and not taking into consideration cuts proposed by Defense Secretary Louis Johnson below the 41-pp \$14 billion.

More Weight, Less Planes—General aviation is based primarily on the performance for deliveries has orders placed in 1949 fell less than 10 percent current of production less than deliveries are not expected to increase and new even decrease.

Reductions in funds because of decisions by President Truman and Secretary Johnson are not expected to keep down accompanying civilian production and employment in the aircraft industry until later in 1950.

Sales volume for 1949 for all air travel, engine and propeller companies was estimated by AIA at \$1.7 billion. Profit estimates are uncertain because

of uncertainty, but it was estimated that profit before amortization for most companies would be slightly higher than last year.

Military aircraft production: for calendar year 1949 is expected to reach 24,000,000 engine pounds as compared with 21,000,000 in 1948, the AIA's military aircraft production was expected to exceed the 1945 output production of 200-300 planes by two in three hundred planes.

Aircraft transport aircraft production in 1949 will amount to less than 120 units plus an additional 45 smaller two-engine transport planes. This compares with about 200 transports and aircraft in 1947.

The aircraft industry employed approximately 218,000 people during 1949—165,000 in aircraft plants, 61,000 in engine plants and about 5100 in propeller plants.

Unified Transport Program Asked

A mass unified industry group for regulating and promoting the various types of transportation has been suggested to President Truman by Secretary of Commerce Charles Sawyer.

Charles Sawyer observed that some of the 51 billion spent by the federal government on procuring transportation may be going to sea and water in the expense of railroads, which are the most important mode of transport. He said that at times the Interstate Commerce Commission, Civil Aeronautics Board and Maritime Commission work at cross purposes in regulating this particular phase of the nation's transportation.

Waste Money—At a time, shippers and passengers don't always get the most economical form of transportation, and the cost burden is borne partly by the taxpayer. One of Sawyer's most positive recommendations was that agencies be more closely coordinated so that they be closely kept in touch and not hinder in the name of public safety.

The Commerce secretary declared that the federal government should undertake as soon as possible a study aimed at streamlining air changes for transportation facilities provided at public expense.

Safety Problem—Sawyer said one possible issue to be heard is whether present circumstances justify coordination of separate facilities for air transportation to act both in the Civil Aeronautics Act. He urged re-evaluation of the change that the present system of air mail subsidies places a premium on efficiency and produces the efficient carrier.

The report stated that if another type

of cancer at a different stage of the same type or perform a service at a profit it is entitled to the business, and persons which are being conducted should protect themselves to operations in which they have a clear economic advantage. "Services which no longer are to be furnished at a profit should be abandoned."

◆ **Contract Carriers—Receipts** look a dim view of CAA's efforts to curtail its jurisdiction over contract carriers. He said that later contract carriers operate without a subsidy, efforts to reduce the scope at the pricing of their operations would tend to destroy the effectiveness of these services in furnishing a convenience with the efficiency of established carriers.

"Extension of regulatory controls in this field might also discourage the development of new and novel enterprises," the Commerce secretary declared.

Airports Declining

Starting airports are closing or fast to or before this new one are being built, according to a recent CAA study. This is despite the fact that long-range service terminals will for many years U.S. airports to arrive at sections of the nation adequately, and the CAA-administered Federal airport construction program continues to finance new airport construction.

In the first six months of 1949 there were 224 airports abandoned while in the last six months of 1948 the number closed was 119. A net increase in the total number of airports of all types at the end of 1948 was 555, due to opening of nearly 1000 new fields, but the net increase for the first half of 1949 had declined to only 39 airports. The report, and there are indications that the last half of the year's totals will show a net decrease.

CAA advisers explain the paradox like this:

- ◆ **Landed miles** has increased in many sections so that land owners who have leased airports are converting the land to more profitable uses after farming operations, etc.
- ◆ **Commercial airports** operated by private capital for public use, far from increasing, represented 62.2 percent of all airports closed in the 18-month period surveyed, with a total of 127 fields that were closed. Poor management, poor location, unfavorable local arrangements, the serious drop in highway rates, and the rapid expansion and equally rapid outbalancing of the C3 system (high-velocity program) are factors in the commercial fields' closing. RJA considers old fields abandoned in the first six months of 1949 approximately 71 percent was on leased land.
- ◆ **Revenue in military airports** was in-

cluded in the projection in aircraft and personnel of the services after the war, while decreases in CAA-administered fields, and those operated by other government services, was seen in due to establishment of comparable or better facilities nearby operated by nonmilitary. A similar source probably accounted for closing of a large number of the 32 private airports shut down during the period surveyed.

RTCA Gets Award

The Radio Technical Commission for Aeronautics was awarded the Collier Trophy for 1949 for the work of its Special Committee No. 11 which drew up the basic plan for an all-weather navigation system.

The RTCA program which is now in the initial phase of implementation calls for an expenditure of \$1.5 billion for electronic navigation and traffic control equipment during the next 14 years. It involves a joint effort by the Civil Aeronautics Administration, the U. S. Air Force and Navy in developing, installing and operating the all-weather navigational system.

Formal presentation of the trophy to RTCA officials will be made at the White House by President Truman on Jan. 10. The Collier Trophy Committee was headed by Louis Lorentz, president of the National Aeronautics Association.

The RTCA No. 11 report was based on two phases headed by Col. Joseph Doolittle of the Air Force and Capt. A. S. Tom of the Navy. Milton W. Arnold, vice president of the Air Transport Union, was the key figure in the committee proceedings. RTCA is a voluntary association composed of representatives of military and civil aviation interests, and includes representatives of airlines, manufacturers, pilots and private pilots.

Symington Retorts On Seattle Protests

Seattle's emotional protests against the Air Force decision to transfer some Boeing bombers to the new base at Wright-Patterson Air Force Base, Wis., have brought a "Direct Flight" campaign from Air Force Secretary W. Stuart Symington. In a letter to Senator Warren G. Magnuson of Washington, he said:

"As you know, most of the airplanes moved from various points in and out of Boeing's neighborhood, protesting against its relocation, made so on a one-way, to build the B-47 bomber at Wichita, Kan. Boeing's production in Seattle the B-47, C-47 and the new B-47. There never has been any plan to take any additional business out of Seattle, but close down the Boeing plant in Seattle. In fact as a result of my

recent visit to Seattle, arrangements were made to give additional business to Boeing. Nevertheless, criticism of Air Force policies by various people in your locality has not lessened, either it would seem to have increased."

"I do not see how such criticism on the part of these people can help what they say they like, business naturally. The Air Force is becoming increasingly cognizant of such criticism and air attacks which are not based on the truth."

Symington also declared online a change made in Spokane, Wash., that the Air Force is dropping thousands of new jobs in that city for developing, and then back to Seattle when needed. Prototype for the XB-52 is under construction at Boeing's Seattle plant. With Westinghouse production virtually completed and C-47 orders less than had been expected, Boeing's payroll is on the way down, one being about 15,000 total as compared to a peak of 25,000. The downward trend in employment is expected to continue throughout next year and into 1951.

Power Expansion Sought for AEDC

Tennessee Valley Authority will go to Congress in January for funds to build a 357-million dollar electric generating plant to provide additional power for the new USAF Air Engineering Development Center near Tullahoma, Tenn. (Aviation Week, Nov. 22).

Besides supplying power for wind tunnels and other test facilities at AEDC, the new TVA plant will also provide additional power for the Atomic Energy Commission's Oak Ridge Plant, facility at all peak hours when other power demands are reduced.

The new Wilson's Creek steam plant will be constructed on the Tennessee River at the closest point to the B-47 home AFPC site, four miles south of Ridgeport, Ala. and 20 mi. northwest of Chattanooga, Tenn. Plans call for two 125,000 kw. turbo generators.

TVA expects little opposition to its plan to construct the new plant because of its dual purpose in adding atomic protection and re-research.

Tip Transport

(McGraw-Hill World News)

South African Airways and east coast have developed a method of transporting indigenous notopods through the way they fly South African Airways DC-4s operating between Johannesburg and London. The technique eliminates the time lost during pre-flight ground training to protect plane crew and flight against radiation.

AERONAUTICAL ENGINEERING

Appearance of grid on metal test specimen (left) just prior to fracture shows localized elongation around 0.4-in. hole

and demonstrates possibility of technique in measuring structural deformation in testing in stress zones. Magnified view

(right) of low high-strength aluminum specimen, with grid showing localized elongation in vicinity of hole

New Photo-Grid Method for Sheet Studies

Procedure gives greater accuracy in judging effects of forming action on high-strength aluminum alloy.

An improved photo-grid technique for determining elongation of sheet metal has been developed at the National Bureau of Standards to overcome difficulties involved in other methods and provide a more reliable procedure for establishing the behavior of sheet during forming.

In addition, the technique is being used in the investigation of plastic deformation in the vicinity of holes and in studies of other structural discontinuities that exist in engineering stresses.

◆ **Formability** follows—The new development is important because interest in the formability of sheet has increased greatly with the use of higher strength materials in aircraft, where improvement in strength frequently is accompanied by a reduction in material ductility.

Assessment of elongation in a 2-in. length—a detail usually found in sheet metal specifications—is not a reliable guide for predicting formability, because the elongation may not be distributed uniformly, and frequently may be confined to an extremely small area.

It has been suggested that the elongation over a 10-in. length, equal to the length of the hole in sheet approaching

also, corresponding to reduction in area, should provide a better basis for predicting sheet metal formability. Since accurate determination of reduction in area is difficult for thin sheet, most attention has been directed to the measurement of elongation over short gage lengths.

A marked advance in the technique of measuring elongation over short gage lengths followed the development of a photo-grid process by C. A. Berens and R. B. Chao, Jr. by using pins mounted on test specimens. In that process, a registration is made from cross-hatching photo or a photoemitter's glow screen. The surface of the specimen is scrubbed with isodirectional photoemitter glow, exposed in contact with the specimen, and rinsed with water. It is then dipped in dye to color the glow, which has been scattered (visible by the exposure).

New Grid Marking—When the film was initiated its position, under control of the National Aeronautics Committee for Aeronautics, to obtain stress-strain and elongation data for high-strength aluminum alloy sheet used in aircraft, an accurate grid having gaps of about .01 in. was desired.

It was found that existing grids were not suitable for accurate work, because of excessive wear of lines, excessive spacing or lack of line sharpness, when measured at high magnification.

To meet this problem, a master grid—2.07 x 2.16 in. overall—was prepared by using the grid in wax on plate glass, etching the lines in the glass, and filling them with lead solder. The lines are about .015 in. wide and are spaced normally .25 mm apart.

A careful study of a negative obtained from the master grid by contact printing indicated that in the middle portion, where the lines are most accurate and whose measurements are taken at each hole, the system was within .01 percent of the nominal value.

In the past, investigators have experienced much difficulty in obtaining considerably satisfactory lines by using photoemitter glow. Specifically, the lines are not straight, and the time needed for exposure is quite variable. However, lines of excellent quality were obtained at the Bureau, with the present system as used in aircraft.

◆ **Specimens** Prepared—After the photoemitter glow by the Bureau's high-power technology section has printing lines on inside specimens. Thereafter cleaned at grain and other foreign matter and wiped with alcohol as

Graphs obtained using new grid technique. Curves (top) show load elongation measured on two 750T shear specimens loaded in tension in direction of rolling. First values at about 50 percent were in fracture vicinity; elsewhere elongation was 10 percent or less.

Curves, below, show elongation for various gage lengths. Elongation, measure of ductility, usually is taken over 2-in. gage length. Actually, in many cases, forming occurs over much shorter lengths, for which elongation, or strain, is given.

time, the specimen is mounted in a holder and coated with a small amount of cold top enamel. The holder is then run at about 900 rpm for 10 min., or until the enamel on the strip is dry.

The developed specimen is removed from the wheel and placed in contact with the film negative of the grid as a vacuum frame. A 4-min. exposure at about 12 in. from an S25-6 camera flash lamp has generally proved satisfactory.

However, the test of the specimen is affected by the relative humidity—the enamel becoming less sensitive with higher humidity. Also, the sensitized specimen should be exposed and developed immediately, since it will keep but a short time.

► **Developing**—The image is developed by immersing the specimen in sensitized cold top developer (granule shade preferred) for about 20 to 40 sec. A dye incorporated in the developer makes the image on the metal visible. After developing, the specimen is quickly rinsed for a few seconds in two baths of alcohol (95 percent) and immediately dried in air. The sensitizing and developing should be done in a dark room illuminated for ordinary photographic work. Since the film negative does not

indicate its dimensions during processing and during changes in relative humidity and temperature, a length equal to 50 or 100 spaces near the middle of the gage length of the specimen is measured to determine the average grid spacing.

Measurements before and after test are made with a binocular microscope under a 50 to 100 magnification reading to 0.0001 in.

CV Uses Forging To Minimize Parts

A new method of constructing some beams used in fighter aircraft, which eliminates many fabric operations previously required and permits large savings in production time and money, has been developed by Chance Vought Aircraft division of United Aircraft Corp., Dallas, Texas.

In place of the conventional, but costly, procedure of building up three struts with acres of individually fabricated parts which are joined together, CV now quickly shapes out a one-piece beam in the machine shop—then a single, large forging.

These forgings—said to be some of the largest ever produced in the U. S.—are 750T aluminum alloy and are pressed from 120-in. round bars, 64 in. in diameter. They are specially made for Chance Vought on a new 18,000-ton press at the Wynton Gordon Co. in Worcester, Mass.

Weighting 515 lb before machining, the forgings are formed in two steel die blocks, each 21,000 lb.

At CV, the forgings are placed on a 36 x 55-in. Cincinnati Vertical Hydraulic machine equipped with tooling especially designed to profile the main beam. While a hydraulically operated turning wheel moves around the surface of a pattern, the lathe automatically performs 90 percent of the total machine operations, as the beam is a fraction of the time formerly spent by craftsmen on individual parts of a built-up structure.

CV points out that many workers formerly engaged in assembling and fitting these beams have been released for other duties. Indirect labor has been reduced by eliminating work orders and records needed for each of the many parts making up the old beam. And stock clerks, who formerly had to look down dozens of details, now have only one large part to handle.

Fixed Tip-Tanks Emptied Quickly

Latest design variable air refueling fuel tanks in the use of a patented wingtip installation on the Cessna F440 Mustang, Navy jet carrier fighter. Instead of situating the tanks, either upon extension of fuel line in wingtip, high-draw pump vents empty tanks in just 40 sec.

A variety of reasons has been advanced for the use of fixed wingtip tanks. First cost of about \$100 each is an important economic reason. Damage to people on the ground is a safety reason. A very good aerodynamic reason exists, however, in that the plate effect of the tanks increases the effective aspect ratio of the wing.

The fast emptying feature is obtained by opening a check valve at the tank nose, and dynamic air pressure does the rest, forcing the fuel out the dump valve. Airspeed must be at least 250 mph to insure this fast action.

First public demonstration of the dumping equipment was at the 1949 National Air Races. The Navy "Blue Angels" were then dumping fuel and liquid from their tanks to create a picturesque red, white and blue trailing maneuver. Now McDonnell F2H-2 Banshee fighter also incorporates fixed wingtip tanks.

Commercial Airliner or Private Fly-About...

... Records Show Finest Engine Performance with

Mobiloil AERO

AFTER MORE THAN 1,000 FLYING HOURS

- Valve engine parts still clean
- Long life, with minimum deposits in ring area
- Excellent, trouble-free and reliable, after 1,000 hours of operation

Guarantee of vital engine parts — after more than 1,000 hours between overhauls — is an indication of a lubricant's superior quality. Time after time, every type of plane — records show finest performance with Mobiloil Aero.

Mobiloil Aero is approved by all leading aircraft engine manufacturers.

twice. It requires Aero, Navy and Air Force Specifications. What's more, you'll find Mobiloil Aero always within cruising range at over 1,200 U. S. airports from Coast to Coast.

Convertiplane Interest Grows Fast

Experts convene to exchange design philosophies on convertible aircraft configurations. Optimism is noted.

By Robert McLean

Although it has been only a little over 10 months since the first detailed analysis of the convertiplane was published (*Aviation Week*, April 12, 1978), interest in this unusual new type aircraft has grown to such a point that 250 engineers attended the First Convertible Aircraft Congress in Philadelphia, on Dec. 9.

This meeting was organized by E. Burke Wilford, programs director and chairman of the convertiplane, and was sponsored jointly by the Philadelphia section of the Institute of the Aeronautical Sciences and the American Helicopter Society.

The convertiplane is currently in the stage that immediately precedes the birth of a new kind of transportation—discussion of its form. Once this important question is decided, the rest of the Congress left no doubt that the first true convertiplane will become a reality.

No one doubts that a tremendous amount of technical work remains to be accomplished before a successful convertiplane is flown, but the increasing high caliber of personnel concentrating their attention on the new type is indicative of its success.

► **Early Phase:** The convertiplane is a well-known precedent in the aerospace field. Available, venerable George Flunkert, president, Convertiplane Corp., showed interesting historical milestones of the first aircraft in history to change its form in mid-air.

The British Convertiplane made its first flight Nov. 6, 1931 at Niles, Mich. It was a light, single-seat tractor design of mid-wing biplane form. Upper wing of the convertible, via a series of locking mechanisms, rotated about its pivot to create a gull-wing configuration, which permitted slow landing. This British aircraft was designed by Ralph H. McCreery and flown by George Townson, both of whom received awards at the Congress.

The other problem of the convertiplane, then, became one of definition. Available George Flunkert defines the historic origin of the convertiplane but it is equally true that the craft which rises vertically from the ground as a helicopter and flies level as a fixed wing aircraft has not yet been and that is the technical problem defined by the true convertiplane aircraft.

► **Helicopter Approach:** Section of the convertiplane is the aircraft operation was clearly outlined by Dr. K. Helman, chief, aerodynamics, Helicopter Division, McDonnell Aircraft Corp.

He made clear the tremendous interest in the fixed wing and the helicopter control by shifting of the aircraft blade and, in a forty-minute, comprehensible lesson on the advancing blade.

Since these considerations indicate that the helicopter is characteristically incapable of high speed (leading edge velocity helicopter speed around 170-200 mph) by Sikorsky S-51, Pavesi XH201 has his 110 mph, specifically, it follows that its vertical take-off and landing combined with fixed wing design for high-speed level flight.

Helman's helicopter's advance rates (aircraft speed) over its speed as a rotor vehicle in the ability of a helicopter to fly horizontally. Pointing out that current types exhibit an advance ratio of 0.1 to 0.35, he showed how increased advance ratio can be obtained through the use of low values of C_o (coefficient of lift).

Dr. Helman's solution to this problem is to speed up the rotor but Helman's solution pointed out the difficulty of this is that of increasing convertiplane issues is a rotor speed of about 550 mph. He concluded, therefore, that the only practical means of reducing the aerodynamic blade loading and, therefore, achieve higher advance ratio is to reduce the rotor into a fixed wing.

His studies indicate that a rotor blade at an rpm of only 6 percent of the rotor disk area of C_o of 0.6 would give the available advance ratio of 0.6 and higher at a value of C_o of 0.3. His studies also indicate that low advance blade loading greatly simplifies the problem of achieving advance ratio well above 0.5, since the values of lift and drag coefficient tend to become constant at these rates.

He believes that the addition of a small fixed wing to the helicopter would permit it to operate efficiently in the 170-210 mph speed bracket. At these speeds, his calculations indicate that once the rotor disk would be such a small part of the total disc it would be unnecessary to add the complexity of rotor structure when it was in the forward position of safety coasted thereby.

In general, then, he proposes an "in-

tern" type between the helicopter and the convertiplane.

► **Loomed's Study:** Lloyd Loomed, former National Advisory Committee for Aeronautics engineer and one of the earliest serious students of convertiplane problems, presented a study of the true convertiplane, that is, an aircraft which rises vertically as a helicopter, levels out as an airplane and flies level with its rotor as a propeller.

Loomed showed the basic inevitability of the conventional convertiplane in which the rotor is mounted atop the fuselage and tail fin below. He discussed the well-known side force effect of a yawed propeller and showed how a disturbing couple is created by the tail fin.

He concluded that the only is basically stable configuration is one in which the C_o of the craft is above the rotor, and explained that would tests had borne out this theory.

Loomed examined the classic convertiplane problem—rotor efficiency of blades used in a rotor well as a propeller. He explained that there was no magical way in which a single set of blades could be made equally efficient as rotor (for vertical flight) and propeller (for horizontal flight). He presented an elaborate chart showing that convertiplane designs cannot expect an efficiency of more than 50-55 percent in either mode of operation.

He also concluded that three-bladed rotors would be required to permit a smooth transition from hovering to horizontal flight, whereas two-bladed rotors would require awareness of their operation from rotor to propeller phase is the drawback to horizontal flight. Loomed also presented studies of jet and propeller-driven rotors.

► **Helman Head:** One of the distinguished speakers at the Congress was Dr. Arthur Helman, renowned director of the rotor lab (*Aviation Week*, Sept. 18, 1978), who also had a position in the rotor aircraft field, who has now turned his attention to the problem of the convertiplane. He has learned, like any company in this country to pursue such developments.

Dr. Helman, who sees the convertiplane, at least in this stage of the game, as fundamentally a fixed-wing aircraft with auxiliary rotor for vertical lift. Consequently, he developed a "boom principle" in which booms are attached to a fixed wing aircraft. Rotors are mounted on the ends of these booms. The aircraft is lifted vertically by the rotors, after which the rotors are retracted with the booms in a catenary-drag position and the flight proceeds as a conventional fixed-wing aircraft. He believes the drag of such booms will be inconsequential.

► **Applied to "Picket"**—For example,

Dr. Helman presented a suggested solution of his principle to the Picket "Picket" in which a single, thin boom is attached to each rotor wing joined at the bottom around end. His calculations indicate that a 60,000-lb gross weight could be lifted by four 30-ft rotors having a 2500 sq ft disk area with a disk loading of slightly more than 14 lb/sq ft (compared to 14 lb/sq ft for conventional helicopters).

This is a graphic illustration of his belief that the key to the convertiplane is high-powered, highly-loaded rotors, such as those being made and produced low drag in the stored position, as a consequence.

The "boom principle" was derived as a result of his conviction that rotor dynamics must be clear of the head solution of the aircraft.

► **Power Means:** Concerning his latest involvement, Dr. Helman then turned to consideration of power issues for such boom-mounted rotors and presented an ongoing array of various methods through the use of which the light weight and high power of the picket could be used. He believed that a wide variety of jet turbine motors, pumps and weights will be available, thereby, to allow the designer a wide choice for his purpose.

He feels that gear-driving will be required for such highly-loaded rotors since their speed would have to be in excess of 200 rpm in the transition from propeller to rotor operation. As a design principle, he believes that the power loading of the craft as a fixed-wing aircraft must be the same as the craft is a helicopter.

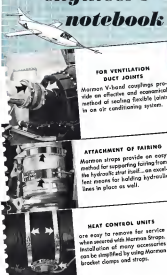

Pointing out that the vertical lift portion of the flight would have a duration of only a few seconds, he believes that the rotor might prove useful and permitting a "rocket turbine" in which the rotor jet impinges on the blades of a turbine wheel.

He also examined liquid rotors mounted at the rotor tips, with their fuel contained in the blades, pointing out that oscillating force would make pumping equipment necessary to fuel delivery to the tips.

He presented a study of the Picket using rocket-powered rotors, and calculated that the 60,000-lb craft could be lifted with only 14,000 lb rotor thrust using 500 lb of fuel for 6 sec.

► **"Picket" Design:** Gordon Zimman, noted inventor of the "Flying Picket" and a noted student of low speed rotor problems, presented his many years of experience leading to the development of the well-known Vought V-173, fixed wing model of the Vought XP-70. This old aircraft was actually a convertiplane in concept—it took off as a conventional fixed wing aircraft but converted to rotor

Choose Radio
as you choose a pilot . . .

It's good to know, when your plane takes off, that the man up front has safely flown and landed in all kinds of weather over all types of terrain . . . that he has proven he can meet and master every kind of emergency . . . that the simple facts of his log book show that he is beyond question reliable, responsible and up-to-the minute in know-how and performance. *Without a single change, this description of a superlative pilot fits Bendix Radio equipment.*

Check that statement with pilots themselves. They know, because the choices are good that they have flown with Beadco Radio communication and navigation equipment every hour aloft—for *inter phases* and *pilots fly more miles with Beadco Radio than any other model*. That's how easy it is to get the best in radio—just choose it as you choose a pilot, look high and hard at the actual record, and you'll have Beadco every time.

Whatever the Plane or Purpose . . .

Every major illness reflects an imbalanced metabolic condition and originates in a disturbance of the autonomic nervous system. The autonomic nervous system controls every physiological function in all parts of the body.

Hydrolyzable Polysaccharide Beads: Beads attract water to form the grafted form. A single reticulation source, any type of crosslinker, or any combination of polysaccharide—benzene Beadex Beads include a variable level of swelling ratio.

For the private Navy, America's Marine Corps is doing something reminiscent of police work: assigned to every job and every place...from a small battery, spread around an op.

In the present diffusion program, HealthWatch is engaged in helping the target groups to completely new problems. HealthWatch teams engaged the community around the three pillars:

VHF Transmitters + H. F. Transmitters + Radio Control Panels + Antennas + Indicators
Automatic Radio Compressors + Marker Beacon Receivers + Receiving System
VHF Communications and Navigation Receivers + Inter-Communication Systems
H. F. Receivers + Radio-Magnetic Indicators + Ground-Controlled Approach Landing
System + Lightweight Personal Plane Radios + VHF Omni-Directional Range Systems

BENDIX BACHO DIVISION of
EATON & BATHURST

Expert (aka) Reading International Division,
72 Fifth Avenue, New York, NY, New York

Another satisfactory lapping operation is the "scrape" method. Four standard units are shown ready to be driven over top.

needed plug and less pronounced rim. Deviations from parallelism in crystals produced by both lapping methods were noted after ten wipe hits. The first occurred for most of the data, which was shown not to exceed 0.0004 in.

► Two Lapping Units—Because of the difficulty in removing the ring and

leading wire that crystals, a lapping method that permits work under the protection of individual crystals has been evolved.

The new apparatus employed is an improved form of the square block and cell method and consists of two slightly different models—the "plunge" and the "tilt" plunger.

The tilt-type has a control extension and is mounted on a keyed and clearly fitting plunger and cylinder. The crystal is attached to the plunger by a drop of oil. The next is then inserted and placed on the lapping plate. The crystal is then worked between the piston and plate by the cylinder while a nut drives a number of small nuts over the lapping plate.

The tilt plunger model differs mainly in having a taper piston sliding on bearing screws by which the contact of the plate can be controlled to a precise degree.

Crystals have been lapped at the Bureau in 0.01 in. with both these models. Breakage is almost nonexistent, and the contact is quite fast and perfect.

Leaving thickness for the equipment is not too heavy, since the difficulties of handling and properly measuring such crystals impose many new problems that remain to be solved.

Generator Control

A modified, 10-ampere generator control system, in which resources are packaged in one installation to reduce ground maintenance time, has been developed by General Electric Co., Schenectady.

Designed so that only one contact carrying stress of equipment need be involved in generator main power control adjacent to the main bus, system has control relays located in distributor-type panel which is shock resistant and enclosed to protect relays from tampering, oil spray, acid, and vibration. This panel is connected with control wiring by small control cables.

In main generator line are two 150-amp. shunts providing indication for full mechanical contact load protection, a contactor by which generator is switched on and off the line under normal operating conditions, and a reverse current circuit breaker to break up contactor in interrupting high current faults and extreme overloads.

Partial generator is both disconnected and deenergized until fault is corrected. Manual electric switching may be provided. The trip-bar circuit breaker and field relay assure that safe-handling generator can be manually kept in system.

AIR FORCE CONTRACTS

October Total Hits \$34-Billion

Covair tops list with B-36D award for \$40 million. Boeing gets \$11 million experimental plane contract.

Contract totaling more than three-quarters of a billion dollars awarded by Air Materiel Command headquarters in October include that Air Force paid \$158.6 million in getting into high gear.

Fixed price contracts total during the month numbered 568 and added up to a whopping \$11,651,938. In the general category, 296 fixed price contracts totaled only \$16,706,255. (Aircraft West, Nov. 26). All told, AMC awarded the month averaged 591 contracts with a value of \$322,651,816.

In addition, during October, West Los Angeles, Red Bank, N. J., let 12 contracts totaling \$75,797, and Cambridge (Mass.) Research Laboratories got 10 awards valued at \$179,584.

Contract number of AMC's regular 128, as negotiated, and only 123 (valuing \$3,832,031) were entered into after formal advertising. AMC placed 223 contracts valued at \$8,263,865 with small businesses (which are defined as those employing less than 500 people).

Another interesting feature of AMC's October procurement action was the use of non-plant-and-facility contracts—14, totaling \$61,528,940, in September. CPWF contracts numbered 22, but with a value of only \$22,867,562.

At Wichita, eight contracts valued at \$62,877 were negotiated, and four, aggregating \$7782, were entered into after advertising. Six contracts worth \$16,512 went to small businesses. Chrysler negotiated six contracts totaling \$148,822, and let 12 worth \$29,766 after advertising. Eight awards valued at \$13,361 were granted small local firms.

► **Consolidate Top**—At the top of the list of AMC awards in October was One Solid Vehicle Aircraft Corp. which submitted a B-36D. A CPWF contract, the vehicle was entered into in August, although only being used in October. Work is scheduled for completion by July 1951.

Other major items in Covair's awards was a \$3,324,475 contract for

12 T-33A transport trainer, along with spare parts, tools, etc., flight training, etc. This is scheduled for completion in April, 1951.

Boeing's New-England engineering contractor during October and Boeing Airplane Co., which received five awards totaling \$11,241,688, largest of which was for \$11,241,125, and covered "consulting experimental airplane." It is a CPWF contract.

\$100,000 and Over

Advanced Laboratories Inc., Long Island N. Y., took a \$70,000, Oct. 1950, \$1,700,000, Oct. 1951, \$1,700,000, Oct. 1952, \$1,700,000, Oct. 1953, \$1,700,000, Oct. 1954, \$1,700,000, Oct. 1955, \$1,700,000, Oct. 1956, \$1,700,000, Oct. 1957, \$1,700,000, Oct. 1958, \$1,700,000, Oct. 1959, \$1,700,000, Oct. 1960, \$1,700,000, Oct. 1961, \$1,700,000, Oct. 1962, \$1,700,000, Oct. 1963, \$1,700,000, Oct. 1964, \$1,700,000, Oct. 1965, \$1,700,000, Oct. 1966, \$1,700,000, Oct. 1967, \$1,700,000, Oct. 1968, \$1,700,000, Oct. 1969, \$1,700,000, Oct. 1970, \$1,700,000, Oct. 1971, \$1,700,000, Oct. 1972, \$1,700,000, Oct. 1973, \$1,700,000, Oct. 1974, \$1,700,000, Oct. 1975, \$1,700,000, Oct. 1976, \$1,700,000, Oct. 1977, \$1,700,000, Oct. 1978, \$1,700,000, Oct. 1979, \$1,700,000, Oct. 1980, \$1,700,000, Oct. 1981, \$1,700,000, Oct. 1982, \$1,700,000, Oct. 1983, \$1,700,000, Oct. 1984, \$1,700,000, Oct. 1985, \$1,700,000, Oct. 1986, \$1,700,000, Oct. 1987, \$1,700,000, Oct. 1988, \$1,700,000, Oct. 1989, NEW AVIATION PRODUCTS

New Refueler Speeds Gas Handling

Light, portable equipment suitable for underground pit service, supplies fuel at 200 gal. per minute.

A new type of aircraft refueler which delivers gasoline about twice as fast as conventional equipment is being studied by major airports and airlines. Made by Bowers, Inc., the refueler supplies diesel gasoline through a single, standard-type suction hose at the rate of 200 gpm. It will deliver at a speed of 50 gpm. Fuel delivery rate through a single hose on tank trucks currently used is 33-52½ gpm, and the refueling speed is cited at about 10-40 gpm.

The new equipment is noticeably light—it already has been tested on a comparatively small tank for demonstration purposes—and its design makes it particularly adaptable for service in underground pits on the airport apron.

Key Handling-Bowers points out that its system is not a radical development, but rather a very effective look-alike of already proven devices. An especially interesting feature is a mechanism which automatically senses the hose at tap in the service main ports at its end. When

the stage rolling, the hose reel stops revolving—like a charmed circle. After unroll, it gives a steady steady tug on the hose and it starts rolling back on the reel.

The hose is said to be lighter than usual, because it is always empty inside, fairly built and after refueling. Also, the nozzle is made of lightweight material, permitting loading of the hose with one arm while filling operations are taking place.

• Safety—Although the entire refueling operation can be controlled by one man at the remote, no electric wiring or switches are used both on the nozzle and the fuel dispenser. Motors on the equipment actually draw the exact amount of gas delivered to the tank from the service tank.

Details of a second company demonstration at the Bowers plant at Fort Wayne, Ind., assure that it is proved without a hitch and backed in actual operation at the airport port which made the equipment.

Maintenance Aid

Designed for close-quarter work, units of fugal, single head wrenches, specially built tools and temporary for replacement and long-term, are offered by Simpson Tool Corp., Kenosha, Wis.

Wrench heads are set at different angles to handle one 16 and eight 60 deg. Sorel both heads in one unit are once size, switching ends permits turning nuts in narrow swing area. This head only 2 in. or larger and set are attached to numerous standard tools.

Head's periphery supplies one or two-quarter, while giving extra tool strength at the point of greatest stress. One-head design, close quarter, close fitting, openings. Four rows are available, with 1/4, 1/2, 3/4 and 1 in. openings.

Aircraft Energizer

Switch, for medium requirements of low-voltage d.c. power for aircraft, airports, and aircraft testing stations, light-weight ground power supply is made by Sael and Melton Motor Division, General Electric Co., Schenectady, New York.

New 765 amp. 7.5 kw. unit was developed to meet the demand for smaller size for general purpose use. High over 1000 amp. line 1 run and dual range of regulated voltage at both 14 and 28.5 v. provides wide range of applications to aircraft equipment. Compact package allows simplified power supply for aircraft testing and maintenance work, for installing small, unobstructed aircraft engines, for radio and radio test unit, charging batteries, and similar low-voltage jobs.

Low voltage range of converter is 11-17 v., while high range is 25-35 v. Voltage regulation is ±2½ percent over entire range.

Basically, equipment consists of a two-unit, transformer, self-regulated motor-generator set with a control unit mounted on top. Two-wheel dolly can be supplied for convenient manual handling.

Indicator meter for engine is G-E Type K spans range, 220/440 or 350 v., 2 or 5 phase, 60 cycle.

Instrument Rectifier

CX14 copper clad rectifier for instrument application, is manufactured by Rectifier Laboratories, Inc., New Haven, Conn.

Unit features gold-plated internal circuit arrangement made up of vacuum processed rectifier plates with gold contacts, specially plated gold terminals and copper alloy busbars. Rectifier is designed to insure precision speed and high efficiency. Factory test procedure is used to attain constant under load temperature variation.

Temperature and tested to a different service loadings, unit also is design resistant. Its construction is claimed to eliminate many difficulties found in instrument devices because of mechanical stress. According to manufacturer, unit meets stability under extreme operating conditions as tested with CX19. Rectifier measures $1 \times 1/2 \times 1/2$ in. and weighs one 2-66 x 1/2 oz.

Aircraft Shuttle Valve

For aircraft hydraulic systems, 3000-psi shuttle valve which meets or exceeds requirements of Spec. AN-57b is manufactured by Parker Aircraft Co., 17125 David Ave., Cleveland 17, Ohio.

Designed in accordance with drawings AN577 and AN578, and built in size units 6 (1/2 in. tube o.d.) and 8 (3/4 in. tube o.d.), unit will shuttle directly closed line and will not react from surge flow or negative pressure. Surge flows and shut down valves suit.

Valve shows no evidence of deformation or failure at burst test pressures of 7500 psi. It has pressure drop less than maximum of 10 psi when operated at rated flow.

Unit shows zero leakage at static pressures of 5 and 3000 psi, or at proof pressure of 4500 psi, or while shuttling under use as all pressure, and only in Richtel standard leakage (less than 100 cc./hr.) tested after 20 hours of continuous shuttling at 1500 psi. Tests also show shuttling pressure does not exceed 60 percent of allowed maximum, and that there is no leakage during temperature changes from -55 to 105°F.

Portable Mixer

For grinding slabs in gluing tanks, oil and water quench tanks, and in preparing drying compounds, portable, mixing is achieved in accordance with An Equipment Corp., Bryan, Ohio.

Unit can be quickly changed into position on the edge of tank or drum. Swivel clamp permits quick adjustment to desired angle. Air valve at top of motor connects to air hose and works when air supply is cut.

Motor may be selected in a choice of five models with speeds of 500, 1200, 1500, 4500 and 17,000 rpm. The 500 and 1200 rpm motors are 4 in. long—actual weight is 2 1/2 lb. 6 in. Motor is built-in, mounted in oil steel housing with corrosion resistant finish. Mounting clamp works in ball socket permitting angular adjustment of unit within 90 deg. arc, and can be rotated 360 deg. horizontally.

Shoring rods are available in 12, 18 and 24 in. lengths. Maximum pressure (with or without load) can be used in place of rigid base on shoring rod.

Lab Thermometers

Line of thermometers indicates for industrial and laboratory use made by General Electric Co., Schenectady, N. Y., includes resistance thermometers for temperatures up to 3000°F and cold, compensated thermocouple thermometers for measuring up to 3000°F.

Designed for low temperature where high accuracy is important, resistance thermometers are suitable for bearing temperature measurement, generator

and transformer-winding temperature indication, refrigeration and air conditioning testing, diving operations, remote heat resistance indication, and laboratory work. They are available in two standard types, D8-15 and D8-7, 6 in. diameter, surface and both mounted instruments.

Thermocouple thermometer can be used with industrial furnace, melting pots, molten drying ovens, oil quenching baths, erosion lines, and salt baths for measuring. They also are available in two sizes, Type D8-10 with 3/4 in. flange and D8-71 with 3/8 in. flange.

Sound Probe

For troubleshooting aircraft on order test mechanisms, electronic sound probe sold by Com-Tec Co., 170 W. Lake St., Chicago 3, Ill., is designed to locate sound and bring it to a level point to permit accurate tracing to source. Sound is amplified to quality detection whether it is a normal or foreign element in particular mechanism being checked.

"According to company, driver" brings out a natural amplification of sound at the source, but greatly amplified or distorted. When at last for a particular noise in a motor or bearing, we not only hear it but we are able to identify it, because all foreign or built up sounds are clear."

High Strength Solder

In actual, instrument as shown as photo shows where this flowing, low temperature solder is required, Eutectic 192, lead solder-type alloy for joining aluminum in steel, alloys or copper, as well as to aluminum, is manufactured by Electric Welding Alloy Corp., 40 Worth St., New York 13, N. Y.

Classed to give highest strength bond ever obtained between aluminum, bronze and stainless steels, and all alloys in 20 years of company research, product is reported to have bonding temperature of 619/708°F, tensile strength of 11,000 psi, good corrosion resistance and high electrical conductivity. It is available in 5 lb. and 4 lb. rod form.

Quality Control Rule

Slide rule, developed in accordance with basic principle of quality control as adapted by American Statistical Association, has special series, in addition to the traditional log scale arrangement. Made by Pickett & Baker, Inc., 5 South Wabash Avenue, Chicago 3, Ill., device also has ordinates and lines for normal curve.

Designed to solve many problems arising in quality control, the two new series of scales to control quality of product whose quality characteristics are measured, such as length, diameter, or accuracy. These scales also can be used for measurement of electrical characteristics in chemical processes.

Another group of scales is used to compare limits the process actually is conforming with those specified. One scale is used to find limits for charts for percent of parts defective. Although the calculation is one of the most difficult and tedious in elementary quality control, this slide rule handles it with ease.

Weighing less than 4 in., rule has no spring, light metal case with

Tight-Grip Pliers

No. 150-B slip joint pliers with self-adjusting, offset by Ultra Drop Forge & Tool Corp., Union, N. Y., are designed to give more holding power for work twisting and pulling when "bite" equipment components are used. Point grip handles permits tight hold with less effort and reduces wrist fatigue. Made of forged alloy steel, pliers also are said to be specially made for work where it is necessary to get into tight places.

A Lesson From the Wright Brothers

(Editor's Note: In the high-pressure, high-speed environment of present-day aviation, a reminder of human values in aviation such as that presented by Charles A. Lindbergh in his brief Washington talk at the 50th anniversary of the first powered flight by the Wright brothers, should not be overlooked. Likewise, Mark Twain's publisher, the Lindbergh talk is full as a sermon to its reader.)

—ROBERT H. WOOD

Orville and Wilbur Wright will always inspire the men who follow them in aviation. To be awarded the trophy which bears their name is an honor I appreciate beyond the ability of any words to describe.

Looking at the model of that early plane brings conflicting emotions to my mind. We who meet on the anniversary of Kitty Hawk have marveled at the growth and changing forms of aircraft. Many of us have seen, with our own eyes, the man-of-war of the Wright brothers use superior prototypes with close to thirty times their speed. Now, we plan huge rockets that will travel faster than a rifle's bullet, far thousands of miles. And we talk about flying to the moon as easily as people talked about visiting new cities in another place that December day at Kitty Hawk.

The Wright brothers, with their first power-driven flight, opened the door to all this progress. They are symbolic, to us, of the pioneer—his daring, his vision, his tenacity. They represent a quality in Western men without which our civilization could not survive. For generations, we have heard our progress on discovery, and presented our nations through the invention and use of new tools. Today, whether it be for peace or war, we Westerners depend on wings. We depend on gun, plane, and false construction of men like the Wright brothers.

But the Wright brothers, being pioneers, also symbolize a quality of life which exists in no atmosphere of scientific progress. As they represent progress on the one hand, they represent the "log cabin era" of aviation on the other. And from the log cabin, there is much that modern man could learn.

One need only glance at a picture of their first flight to realize the difference between the life they lived and one Orville has placed in the open air, on top of his lower wing, while Wilbur runs with him, against the wind, over a steady flat. While their minds were studying direction and the shortcomings of flight, their bodies were in contact with rain and earth, and weather.

We hear speakers speak nostalgically of the era of pioneers and wonder where it is. I sometimes feel that the decline of aviation began with the self-strut and the closed cockpit. Before the advent of these things, and the instruments that went with them, flying was as at that required the use of the body and all its senses in that early environment, a man could keep in better balance. He spent much of his time in the cockpit, but he flew from firmest fields. He experienced the beauty of ascent. His skin felt the fierceness of rain. He had to know texture of earth and feeling of snow to keep him from losing over in a spin. Failing a student engine through lost his position in conditions. He relied on sight of horizon, touch of control, sound of engine. He might even feel a battery by taste.

Now, flying has become a science in the cold records, and the body becomes an increasingly unnecessary

part. Hurding through the air in jet fighters is vibrating through cloud on multi-engine instruments, lower after lower, I realize how artificial flying has become. We no longer sense the qualities of earth and air. We look at almost everything through paint and glass. Today, we press a button to engage an automatic pilot to carry us across an ocean, across, or to drive us across city below.

Our engineers crowd air-conditioned dressing rooms, and seldom see their hands to test their theories. Our pilots fly in supercharged and heated cabins. They judge their weather through inkjet signs and computer paper sheets. As we have progressed in the science of aviation, we have separated our selves from the beloved quality of life.

The dream of the Wright brothers was to build a power-driven airplane, and to fly it successfully. They accomplished this dream, and so, their disciples have perfected it in a high degree. Now, in so many phases of modern life, we are faced with a different problem. How are these perfected events to be used for the benefit of man, to raise his standards to the deeper sense?

Great failures fail at wisdom, great speeds over the surface of the earth, great destruction power—such have not impressed, they are even central in our survival in these chaotic years. But in themselves, they do not contribute to the quality of human life. We must not let science become an idea believing that simply by using in form of debt and driving toward and instruments all day, we are contributing to the quality of man.

Personally, I am concerned that man cannot thrive healthily in the last-known atmosphere we are creating. I believe that for permanent survival, he must balance nature with other qualities of life, qualities of body and spirit as well as those of mind—qualities he cannot develop when he lets mechanics and heavy science run too freely from the earth to which he was born. We must realize that even taste and judgment depend upon the body as well as on the mind. It is for this reason I say that the Kitty Hawk plane offers something essential to man. As it symbolizes our progress, it also symbolizes qualities of life we have left behind and which, to be successful in a deeper sense, we must retrieve.

How can we retrieve these qualities? Certainly we cannot turn back the clock. Certainly it cannot be done in any revolutionary way without greater loss than gain. I believe it can be done only through a re-orientation of our standards, only by placing the character of man above the value of his products. If we are to be healthily successful, we must measure our life achievements by the quality of our man himself.

In honoring the Wright brothers, it is proper and necessary to emphasize their contribution to scientific progress. But I believe it is equally important to emphasize the qualities in that pioneering life, and the character of men that such a life produced. The Wright brothers balanced success with modesty, science with simplicity. At Kitty Hawk, their activities and success worked in mutual support. They represented man in balance. And how that balance came about to lift a world.

Their work will stretch forward into one of supreme and, possibly, even retro-scientific flight. We cannot predict with accuracy what discoveries and developments the future will entail. But December 17th will always create opportunities for us to learn from, as well as to honor, the qualities of great pioneers.

"thinks" fast for pilots

Sperry's new, simplified gyroscopic indicator, the zero reader, is a fast, reliable, and accurate instrument. It continuously plots temperature, altitude, heading, and radio path information and relieves the pilot of complex mental calculations on approaches and landings—simplifies all those flying procedures, leaving more time to devote to other problems vital to the success of his flight plan.

Sperry's new, simplified gyroscopic indicator, the zero reader, is a fast, reliable, and accurate instrument. It continuously plots temperature, altitude, heading, and radio path information and relieves the pilot of complex mental calculations on approaches and landings—simplifies all those flying procedures, leaving more time to devote to other problems vital to the success of his flight plan.

Sperry introduced the Zero-Horizon, Directional Gyro, Gyroscopic Compass and Gyroplot. Now Sperry

introduced the ZERO READER which is the only instrument ever approaching the performance of a standard automatic flight control system. It provides a new, simplified, and accurate method of developing of all-weather operations.

Developed by Sperry with the

cooperation and encouragement of All-Weather Flying Division, USAF and the Air Transport Association, the ZERO READER is an example of Sperry's never-ending search for new and better ways to improve flying techniques.

Look at the Beechcraft from every angle

BONANZA

greater speed!

184 mph top speed at sea level. Cruises at 170 mph at 8,000 feet, using less than 60% of maximum rated take-off power. No engine overload.

economy!

Only 9½ gallons of fuel consumed per hour. Four people with baggage carried at seat-mile cost as low as 1¼ cents.

safety!

Sturdy framework results in extra safety margins. Rated in utility category at full gross weight, with limit flight load factor of 4.4 G's. plane was subjected successfully to special tests not required by CAA.

strength where it counts!

Note low, sturdy landing gear with wide tread and exclusive cross-bracing of struts. Nose gear position, plus long wheelbase, eliminates pitching, allows greater braking.

style and comfort!

Sound-proofed cabin, handsome roomy interior, room for four six-footers. Ease of entry and exit because of wide autotype door.

... then you'll see why it's a better buy!

Compare these performance features

- Top speed, 184 mph
- Cruising speed, 170 mph
- Range, 750 miles
- Service ceiling, 17,100 feet
- Fuel economy, 9½ gal. per hour

Compare these comfort features

- Exclusive retractable step
- Limousine entrance
- Insulated, sound-proofed cabin
- Quickly removable rear seat
- Luggage compartment accessible two ways

You'll find other "extras" you'll appreciate when you actually see the Beechcraft Bonanza—like the exclusive retractable step, two-way accessibility of the luggage compartment, and maximum visibility. Go over the ship yourself, soon. And for illustrated brochures that go into more details, write today on your company letterhead to Beech Aircraft Corporation, Wichita, Kansas, U.S.A.
